

## MS4515DO

- PCB Mounted Digital Output Transducer
- Combination Temperature and Pressure
- Pressure Ranges from 2 to 30inH<sub>2</sub>O
- I<sup>2</sup>C or SPI Protocol
- Differential & Gage
- Temperature Compensated
- 3.3 or 5.0 Vdc Supply Voltage
- Low Power Option Available  
(standby < 1uA)

### DESCRIPTION

The MS4515DO is a small, ceramic based, PCB mounted pressure transducer from Measurement Specialties. The transducer is built using Measurement Specialties' proprietary UltraStable™ process and the latest CMOS sensor conditioning circuitry to create a low cost, high performance Digital Output Pressure (14bit) and Temperature (11bit) transducer designed to meet the strictest requirements from OEM customers.

The MS4515DO is fully calibrated and temperature compensated with a total error band (TEB) of less than 1.0% over the compensated range. The sensor operates from single supply of either 3.3 or 5.0Vdc and requires a single external component for proper operation.

The rugged ceramic transducer is available in side port, top port, and manifold mount and can measure absolute or differential pressure from 2 to 30 inH<sub>2</sub>O. The 1/8" barbed pressure ports mate securely with 3/32" ID tubing.

### FEATURES

- inH<sub>2</sub>O Pressure Ranges
- PCB Mountable
- Digital Output
- Barbed Pressure Ports

### APPLICATIONS

- Blocked Filter Detection
- Altitude and Airspeed Measurements
- Medical Instruments
- Fire Suppression Systems
- Panel Meter

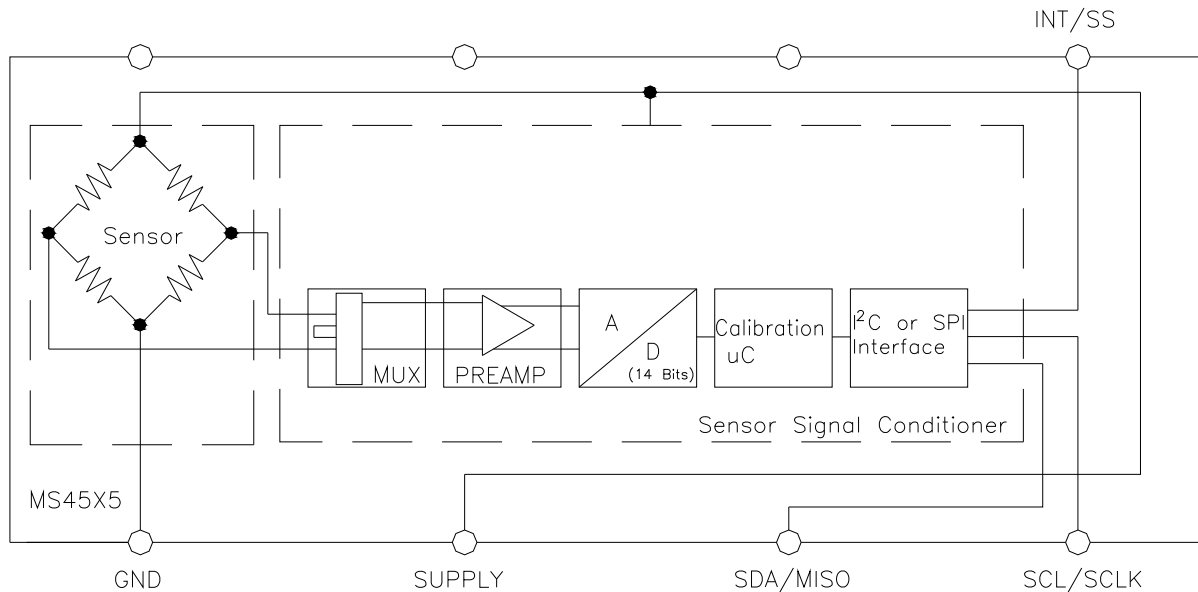

### STANDARD RANGES (IN H<sub>2</sub>O)

Range	Gauge	Differential	Option Availability
2		DS, SS, TP, MM	-L
4	DS, SS, TP, MM	DS, SS, TP, MM	-L
5	DS, SS, TP, MM	DS, SS, TP, MM	-L
10	DS, SS, TP, MM	DS, SS, TP, MM	-F, -L
20	DS, SS, TP, MM	DS, SS, TP, MM	-F, -L
30	DS, SS, TP, MM	DS, SS, TP, MM	-F, -L

See Package Configurations: DS= Dual Side Port, SS= Single Side Port, TP= Top Port, MM= Manifold Mount  
Only I2C Protocol is Available on "L" type Pin Styles; Reference Ordering Information for Details  
Pin Style "L" is only available SS and MM port types.

## ENVIRONMENTAL SPECIFICATIONS

Parameter	Conditions
Mechanical Shock	Mil Spec 202F, Method 213B, Condition C, 3 Drops
Mechanical Vibration	Mil Spec 202F, Method 214A, Condition 1E, 1Hr Each Axis
Thermal Shock	100 Cycles over Storage Temperature, 30 minute dwell
Life	1 Million FS Cycles
MTTF	>10Yrs, 70 °C, 10 Million Pressure Cycles, 120%FS Pressure

## PERFORMANCE SPECIFICATIONS

Supply Voltage<sup>1</sup>: 5.0V or 3.3 Vdc

Reference Temperature: 25°C (unless otherwise specified)

PARAMETERS	MIN	TYP	MAX	UNITS	NOTES
Pressure Accuracy	-0.25		0.25	%Span	2
Total Error Band (TEB)	-1.0		1.0	%Span	3,7
Total Error Band (TEB)	-2.0		2.0	%Span	3,7
4inH2O and Below					
Temperature Accuracy		1.5		°C	4
Supply Current		3		mA	7
Compensated Temperature	0		+60	°C	5
Operating Temperature	-10		+85	°C	
Output Pressure Resolution			14	bits	
Output Temperature Resolution	8		11	bits	
Response Time		0.5		mS	6
Start Time to Data Ready			8.4	mS	6
Weight		3		grams	
Media	Non-Corrosive Dry Gases Compatible with Ceramic, Silicon, Pyrex, PPS, RTV, Gold, Aluminum and Epoxy. See "Wetted Material by Port Designation" chart below.				

### Notes

1. Proper operation requires an external capacitor placed as shown in Connection Diagram. Output is not ratiometric to supply voltage.
2. The maximum deviation from a best fit straight line (BFSL) fitted to the output measured over the pressure range at 25C. Includes all errors due to pressure non linearity, hysteresis, and non repeatability.
3. Total pressure error band includes all accuracy errors, thermal errors over the compensated temperature range and span and offset calibration tolerances. For ideal sensor output with respect to input pressure and temperature, reference Transfer Function charts below. TEB values are valid only at the calibrated supply voltage.
4. The deviation from a best fit straight line (BFSL) fitted to the output measured over the compensated temperature range.
5. For errors beyond the compensated temperature range, see Extended Temperature Multiplier chart below.
6. Start time to data ready is the time to get valid data after POR (power on reset). The time to get subsequent valid data is then specified by the response time specification.
7. This product can be configured for custom OEM requirements, contact factory for lower power consumption or higher accuracy.

# MS4515DO

## CONNECTION DIAGRAM

### Notes

1. Place 100nF capacitor between Supply and GND to within 2 cm of sensor.

## I<sup>2</sup>C AND SPI INTERFACE SPECIFICATIONS

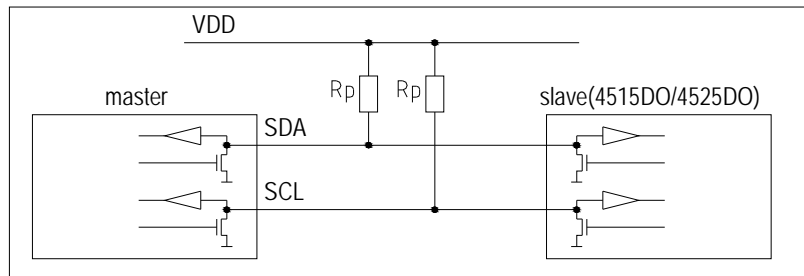

### 1. I<sup>2</sup>C Interface Specification

The serial interface of the 4515DO/4525DO series is optimized in terms of sensor readout and power consumption when the factory setting for I<sup>2</sup>C. For detailed specifications of the I<sup>2</sup>C protocol, see The I<sup>2</sup>C Bus Specification, Version 2.1, January 2000.

#### 1.1 Interface Connection-External

Bi-directional bus lines are implemented by the devices (master and slave) using open-drain output stages and a pull-up resistor connected to the positive supply voltage. The recommended pull-up resistor value depends on the system setup (capacitance of the circuit or cable and bus clock frequency). In most cases, 4.7kΩ is a reasonable choice. The capacitive loads on SDA and SCL line have to be the same. It is important to avoid asymmetric capacitive loads.

#### I<sup>2</sup>C Transmission start Condition

Both bus lines, SDA and SCL, are bi-directional and therefore require an external pull-up resistor.

#### 1.2 I<sup>2</sup>C Address

The I<sup>2</sup>C address consists of a 7-digit binary value. The factory setting for I<sup>2</sup>C slave address is 0x28, 0x36 or 0x46 depending on the interface type selected from the ordering information. The address is always followed by a write bit (0) or read bit (1). The default hexadecimal I<sup>2</sup>C header for read access to the sensor is therefore 0x51, 0x6D, 0x8D respectively, based on the ordering information.

#### 1.3 INT/SS Pin

When programmed as an I<sup>2</sup>C device, the INT/SS pin operates as an interrupt. The INT/SS pin rises when new output data is ready and falls when the next I<sup>2</sup>C communication occurs.

#### 1.4 Transfer Sequences

**Transmission START Condition (S):** The START condition is a unique situation on the bus created by the master, indicating to the slaves the beginning of a transmission sequence (the bus is considered busy after a START).

Timing diagram for SDA and SCL lines. The SDA line transitions from high to low while SCL is high, and then SCL transitions from high to low. A dashed box labeled "START condition" encloses the first SDA transition and the subsequent SCL transition.

**Transmission STOP Condition (P):** The STOP condition is a unique situation on the bus created by the master, indicating to the slaves the end of a transmission sequence (the bus is considered free after a STOP).

Timing diagram for a STOP condition in I2C. The SDA line is high, and the SCL line is low. A dashed box labeled "STOP condition" and "P" indicates the period where SCL is low and SDA is high.

**Acknowledge (ACK) / Not Acknowledge (NACK):** Each byte (8 bits) transmitted over the I<sup>2</sup>C bus is followed by an acknowledge condition from the receiver. This means that after the master pulls SCL low to complete the transmission of the 8th bit, SDA will be pulled low by the receiver during the 9th bit time. If after transmission of the 8th bit the receiver does not pull the SDA line low, this is considered to be a NACK condition.

If an ACK is missing during a slave to master transmission, the slave aborts the transmission and goes into idle mode.

The diagram shows the timing of the SDA and SCL signals. The SDA signal is shown with a sequence of data bytes (D7 to D0) and an acknowledgment (ACK) signal. The SCL signal is shown with clock pulses. The diagram illustrates the timing of the SDA signal relative to the SCL signal, including the 'not acknowledge' and 'acknowledge' states.

13/19

# MS4515DO

## 1.5 Data Transfer Format

Data is transferred in byte packets in the I<sup>2</sup>C protocol, which means in 8-bit frames. Each byte is followed by an acknowledge bit. Data is transferred with the most significant bit (MSB) first.

A data transfer sequence is initiated by the master generating the Start condition (S) and sending a header byte. The I<sup>2</sup>C header consists of the 7-bit I<sup>2</sup>C device address and the data direction bit (R/\_W).

The value of the R/\_W bit in the header determines the data direction for the rest of the data transfer sequence. If R/\_W = 0 (WRITE) the direction remains master-to-slave, while if R/\_W = 1 (READ) the direction changes to slave-to-master after the header byte.

## 1.6 Command Set and Data Transfer Sequences

The I<sup>2</sup>C master command starts with the 7bit slave address with the 8th bit =1 (READ). The sensor as the slave sends an acknowledge (ACK) indicating success. The sensor has four I<sup>2</sup>C read commands: Read\_MR, Read\_DF2, Read\_DF3, and Read\_DF4. Figure 1.6 shows the structure of the measurement packet for three of the four I<sup>2</sup>C read commands, which are explained in sections 1.6.1 and 1.6.2

Figure 1.6 – I<sup>2</sup>C Measurement Packet Reads

## MS4515DO

### 1.6.1 I<sup>2</sup>C Read\_DF (Data Fetch)

For Data Fetch commands, the number of data bytes returned by the RBiCiLite™ is determined by when the master sends the NACK and stop condition. For the Read\_DF3 data fetch command (Data Fetch 3 Bytes; see example 3 in Figure 1.6), the sensor returns three bytes in response to the master sending the slave address and the READ bit (1): two bytes of bridge data with the two status bits as the MSBs and then 1 byte of temperature data (8-bit accuracy). After receiving the required number of data bytes, the master sends the NACK and stop condition to terminate the read operation. For the Read\_DF4 command, the master delays sending the NACK and continues reading an additional final byte to acquire the full corrected 11-bit temperature measurement. In this case, the last 5 bits of the final byte of the packet are undetermined and should be masked off in the application. The Read\_DF2 command is used if corrected temperature is not required. The master terminates the READ operation after the two bytes of bridge data (see example 2 in Figure 1.6).

The two status bits (Bit 15 and Bit 14) give an indication of stale or valid data depending on their value. A returned value of 00 indicate “normal operation and a good data packet” while a returned value of 10 indicates “stale data that has been already fetched”. Users that use “status bit” polling should select a frequency slower than 20% more than the response time.

## MS4515DO

### 2. SPI Interface Specification

The SPI interface of sensor can be programmed for falling-edge MISO change.

#### 2.2 SPI Read\_DF (Data Fetch)

For simplifying explanations and illustrations, only falling edge SPI polarity will be discussed in the following sections. The SPI interface will have data change after the falling edge of SCLK. The master should sample MISO on the rise of SCLK. The entire output packet is 4 bytes (32 bits). The high bridge data byte comes first, followed by the low bridge data byte. Then 11 bits of corrected temperature (T[10:0]) are sent: first the T[10:3] byte and then the {T[2:0],xxxxx} byte. The last 5 bits of the final byte are undetermined and should be masked off in the application. If the user only requires the corrected bridge value, the read can be terminated after the 2nd byte. If the corrected temperature is also required but only at an 8-bit resolution, the read can be terminated after the 3rd byte is read.

Packet = [ {S(1:0),B(13:8)}, {B(7:0)}, {T(10:3)}, {T(2:0),xxxxx} ] Where

S(1:0) = Status bits of packet (normal, command, busy, diagnostic)

B(13:8) = Upper 6 bits of 14-bit bridge data.

B(7:0) = Lower 8 bits of 14-bit bridge data.

T(10:3) = Corrected temperature data (if application does not require corrected temperature, terminate read early)

T(2:0),xxxxx = Remaining bits of corrected temperature data for full 11-bit resolution

HiZ = High impedance

## AVAILABLE OPTIONS

### Gel Coat (-F Option)

The MS45x5 is designed for non ionic and clean dry air applications. Select this option for added protection in high humidity or slightly corrosive environments with the application of a silicone gel elastomer to sensor and ASIC. For questions concerning media compatibility, contact the factory.

### Low Power (-L Option)

Select this option for battery powered or handheld device applications. In this configuration, the sensor and calibration microcontroller are powered down, drawing a current of  $\sim 0.6\mu\text{A}$  ( $V_s=5.0\text{ Vdc}$ ). When the master sends a **Read MR** (measurement request) command ( $I^2\text{C}$  or  $\text{SPI}$ ); the sensor is “awaken” and begins the measurement cycle; data is then placed onto the output registers. The sensor and calibration microcontroller are powered down again, awaiting the **Read DF** (data fetch) command from the master. Reference Figure 1.6 and Section 1.6 for command details.
